A Clear Research Motivation

Strong presentations establish the problem before introducing the method. State the practical or scientific setting, isolate the unresolved question, and explain why it matters to the audience.

Context

Summarise the established knowledge and the assumptions your work inherits.

Research gap

Identify one precise limitation that the study is designed to address.

Key point Express the research question in one sentence that can be tested.

Objectives and Contributions

This template supports short talks, seminars, proposals, and thesis defences. Replace the example statements below with claims supported by your own evidence.

- 1 Define the problem and evaluation setting precisely.
- 2 Present a method whose components can be inspected independently.
- 3 Report results together with limitations and validation status.

Recommended slide rhythm

Alternate text, diagrams, equations, and tables instead of repeating one layout.

Method Overview

Input —, Define the data and units.

Model —, Name the essential transformation.

Output —, Connect predictions to evaluation.

Key point A diagram should expose the data flow, not decorate the slide.

Core Formulation

Let $x \in \mathbb{R}^d$ denote an observation and y its target. A generic objective is

$$\theta^* = \arg \min_{\theta} \frac{1}{n} \sum_{i=1}^n \mathcal{L}(f_{\theta}(x_i), y_i) + \lambda \Omega(\theta).$$

Data term

$\mathcal{L}$ measures disagreement between the prediction and observation.

Regularisation

Ω encodes an explicit preference; λ controls its influence.

Results at a Glance

Method	Accuracy ↑	Error ↓	Runtime ↓
Baseline A	78.4	0.214	42 min
Baseline B	81.7	0.186	55 min
Proposed	85.2	0.151	38 min

Interpretation

Replace illustrative values with verified results and state the evaluation protocol.

Conclusion

The final slide should return to the original research question and distinguish evidence from interpretation.

- 1 State the central empirical finding.
- 2 Explain its significance without overstating generality.
- 3 Name the most important limitation or next experiment.

Key point Thank you. Questions and discussion are welcome.
